

# Ki-67 Proliferation Assessment Report

## Patient Information

Analysis ID	c69be146
Analysis Timestamp	2025-12-01T20:46:48.295717
Patient Name	
Patient ID	
Age	
Gender	
Contact	
Exam Date	
Physician	
Clinical Notes	

## Cell Detection Visualization

Figure: Cell detection visualization with Ki-67 positive cells (green) and Ki-67 negative cells (red)

## Analysis Results Summary

Metric	Value
Positive Cells (Ki-67+)	64
Negative Cells (Ki-67-)	31
Total Cells Detected	95
Ki-67 Proliferation Index	67.37%
Diagnosis Classification	Malignant
Risk Level	High Risk
Malignancy Status	Malignant

## Quality Control Summary

Flagged for Review	No
Reason	Manual baseline unavailable
Classification Match	No

## Clinical Interpretation

Ki-67 index  $\geq 30\%$  indicates high proliferative activity, consistent with malignant characteristics. Requires aggressive treatment protocols and close monitoring.

## Clinical Recommendation

Immediate oncological consultation recommended. Consider chemotherapy, targeted therapy, and surgical intervention. Regular follow-up essential.

## Detection Statistics

Cell Type	Count	Percentage
Ki-67 Positive Cells	64	67.4%
Ki-67 Negative Cells	31	32.6%

## Reference Information

**Ki-67 Proliferation Index Interpretation Guidelines:**

- <5%: Very Low Proliferation (Benign)
- 5-10%: Low Proliferation (Low Malignant Potential)
- 10-20%: Moderate Proliferation (Borderline Malignant)
- >20%: High Proliferation (Malignant)

**Note:** This report is generated by an AI-assisted analysis system. Results should be reviewed by a qualified pathologist and correlated with clinical findings.
